Aim: A) Clustering algorithms for unsupervised classification. Read a datafile all_Customers.csv and apply k-means clustering. Plot the cluster data using R visualizations.

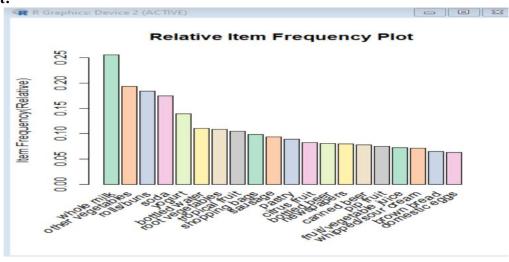

```
Code:
# K-Means Clustering
# Importing the dataset
dataset = read.csv("D:\\bda prac\\Mall Customers.csv")
head(dataset)
dataset = dataset[4:5]
head(dataset)
wcss = vector()
for (i in 1:10) wcss[i] = sum(kmeans(dataset, i)$withinss)
plot(1:10,
   wcss,
  type = 'b',
  main = paste('The Elbow Method'),
  xlab = 'Number of clusters',
  ylab = 'WSS')
# Fitting K-Means to the dataset with no of clusters = 5
kmeans = kmeans(x = dataset, centers = 5)
y kmeans = kmeans$cluster
# Visualising the clusters
library(cluster)
clusplot(dataset,
     y kmeans,
     lines = 0,
     shade = TRUE,
     color = TRUE,
     labels = 2,
     main = paste('Clusters of customers'),
     xlab = 'Annual Income',
     ylab = 'Spending Score')
```

Aim: B) Implement Apriori Algorithm Recommending grocery items to a customer that is most frequently bought together, given a data set of transactions by customers of a store, using built-in Groceries file.

Code:

```
install.packages("arules")
install.packages("arulesViz")
install.packages("RColorBrewer")
library(arules)
library(arulesViz)
library(RColorBrewer)
data("Groceries")
Groceries
summary(Groceries)
class(Groceries)
rules = apriori(Groceries, parameter = list(supp = 0.02, conf = 0.2))
summary(rules)
inspect(rules[1:10])
arules::itemFrequencyPlot(Groceries, topN = 20,
               col = brewer.pal(8, 'Pastel2'),
               main = 'Relative Item Frequency Plot',
               type = "relative",
               ylab = "Item Frequency(Relative)")
itemset = apriori(Groceries, parameter = list(minlen=2, maxlen=2, support=0.02,
target="frequent itemset") )
summary(itemset)
inspect(itemset[1:10])
itemsets_3 = apriori(Groceries, parameter = list(minlen=3, maxlen=3, support=0.02,
target="frequent itemset"))
summary(itemsets_3)
inspect(itemsets_3)
```

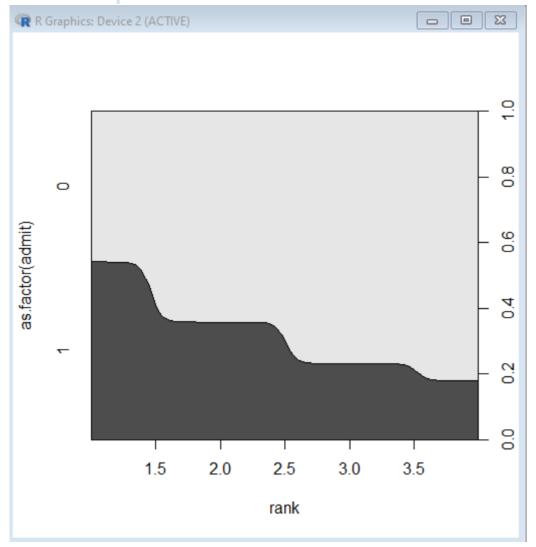

Aim: A) Import data from web storage – binary.csv. Name the dataset and do Logistic Regression to find out relation between variables that are affecting the admission of a student in an institute based on his or her GRE score, GPA obtained and rank of the student. Also check the model is fit or not.

Code:

```
#fetch the data
college <- read.csv("D:\\bda prac\\binary.csv")</pre>
head(college)
nrow(college)
install.packages("caTools") # For Logistic regression
library(caTools)
split <- sample.split(college, SplitRatio = 0.75)
split
training reg <- subset(college, split == "TRUE")
test reg <- subset(college, split == "FALSE")
# Training model
fit logistic model <- glm(admit ~ .,
             data = training reg,
              family = "binomial")
# Predict test data based on model
predict reg <- predict(fit logistic model,</pre>
              test reg, type = "response")
predict reg
cdplot(as.factor(admit)~ gpa, data=college)
cdplot(as.factor(admit)~ gre, data=college)
cdplot(as.factor(admit)~ rank, data=college)
# Changing probabilities
predict reg <- ifelse(predict reg >0.5, 1, 0)
predict reg
# Evaluating model accuracy
# using confusion matrix
table(test reg$admit, predict reg)
```

```
> table(test_reg$admit, predict_reg)
   predict_reg
    0 1
0 59 3
1 28 10
```

Code:

Aim: B) Apply multiple regressions, if data have a continuous independent variable. Apply on above dataset – binary.csv.

```
#fetch the data
college <- read.csv("D:\\bda prac\\binary.csv")
head(college)
nrow(college)
```

install.packages("caTools") # For Logistic regression library(caTools)

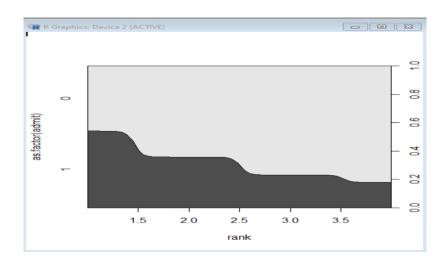

```
split <- sample.split(college, SplitRatio = 0.75)
split</pre>
```

```
training_reg <- subset(college, split == "TRUE")
test reg <- subset(college, split == "FALSE")</pre>
```

Training model

```
fit_MRegressor_model <- lm(formula = admit ~ gre+gpa+rank, data = training_reg)
```

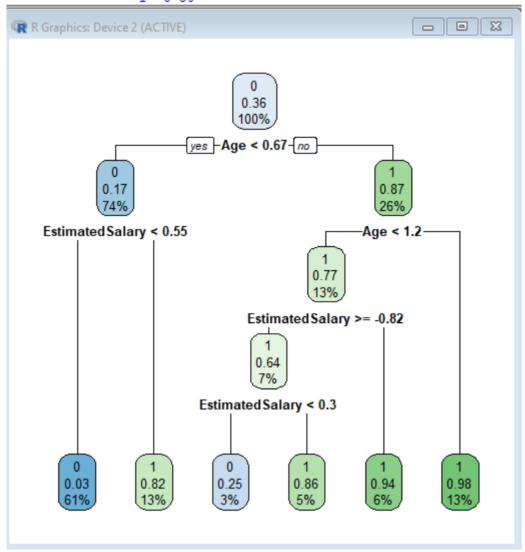

```
cdplot(as.factor(admit)~ gpa, data=college)
cdplot(as.factor(admit)~ gre, data=college)
cdplot(as.factor(admit)~ rank, data=college)
```

Aim: A) Implement Decision Tree classification technique using Social_Network_Ads.csv dataset.

```
Code:
# Decision Tree Classification
# Importing the dataset
dataset = read.csv("D:\\bda prac\\Social Network Ads.csv")
#print(dataset)
dataset = dataset[3:5] \# columns 3 4 ad 5
print(dataset)
# Encoding the target feature as factor(just like a vector having levels
# levels to convey that only two possible values for purchased - 0 & 1
datasetPurchased = factor(dataset\Purchased, levels = c(0, 1))
print (dataset$Purchased)
# Splitting the dataset into the Training set and Test set
install.packages('caTools')
library(caTools)
set.seed(123)
#split = sample.split(dataset$Purchased, SplitRatio = 0.75)
split = sample.split(dataset$Purchased, SplitRatio = 0.75)
training set = subset(dataset, split == TRUE)
test set = subset(dataset, split == FALSE)
# Feature Scaling - scale() method centers and/or scales the columns of a numeric matrix.
training set[-3] = scale(training set[-3]) # scaling first 2 columns, don't consider 3rd column
test set[-3] = scale(test set[-3])
#print(test set[-3])
# Fitting Decision Tree Classification to the Training set
install.packages('rpart')
library(rpart) # for partitioning tree
install.packages('rpart.plot')
library(rpart.plot)
classifier = rpart(formula = Purchased ~ .,data = training set)
# Predicting the Test set results
y pred = predict(classifier, newdata = test_set[-3], type = 'class')
print(y pred)
# Making the Confusion Matrix
cm = table(test set[, 3], y pred)
print(cm)
y grid = predict(classifier, newdata = grid set, type = 'class')
```

Plotting the tree #extra=106 class model with a binary response #extra=104 class model with a response having more than two levels rpart.plot(classifier, extra = 106)

Aim: B) Implement SVM Classification technique using Social_Network_Ads.csv dataset. Evaluate the performance of classifier.

```
Code:
# Support Vector Machine (SVM)
# Importing the dataset
dataset = read.csv("D:\\bda prac\\Social Network Ads.csv")
dataset = dataset[3:5]
print(dataset)
print(dataset$Purchased)
# Splitting the dataset into the Training set and Test set
install.packages('caTools')
library(caTools)
set.seed(123)
split = sample.split(dataset$Purchased, SplitRatio = 0.75)
training set = subset(dataset, split == TRUE)
print(training set)
test set = subset(dataset, split == FALSE)
print(test set)
# Feature Scaling
training set[-3] = scale(training set[-3]) # [-3] means 3rd index will be dropped
test set[-3] = scale(test set[-3])
print(training set[-3])
print (test_set[-3])
# Fitting SVM to the Training set
install.packages('e1071')
library(e1071)
classifier = svm(formula = Purchased \sim .,
          data = training set,
          type = 'C-classification',
          kernel = 'linear')
print (classifier)
# Predicting the Test set results
y pred = predict(classifier, newdata = test set[-3])
print(y pred)
# Making the Confusion Matrix
cm = table(test set[, 3], y pred)
print (cm)
Output:
                         > cm = table(test_set[, 3], y_pred)
                         > print (cm)
                            y pred
                           0 57
```

Aim: A) Implement Naïve Bayes Classification technique using Social_Network_Ads.csv dataset. Evaluate the performance of classifier.

Code:

```
# Naive Bayes
# Importing the dataset
dataset = read.csv('C:\\2022-23\\BDA practical 2023\\Social Network Ads.csv')
dataset = dataset[3:5]
# Encoding the target feature as factor
datasetPurchased = factor(datasetPurchased, levels = c(0, 1))
# Splitting the dataset into the Training set and Test set
#install.packages('caTools')
library(caTools)
set.seed(123)
split = sample.split(dataset$Purchased, SplitRatio = 0.75)
training set = subset(dataset, split == TRUE)
test set = subset(dataset, split == FALSE)
# Feature Scaling
training set[-3] = scale(training set[-3])
test set[-3] = scale(test set[-3])
# Fitting Naive Bayes to the Training set
install.packages('e1071')
library(e1071)
classifier = naiveBayes(x = training set[-3],
               y = training set$Purchased)
# Predicting the Test set results
y pred = predict(classifier, newdata = test_set[-3])
# Making the Confusion Matrix
cm = table(test set[, 3], y pred)
print(cm)
```

Aim: B) Find the confusion matrix to find restaurant review based of sentiment analysis of Natural Language processing. Use Resaurentreviews.tsv file for your study.

Code:

```
dataset original = read.delim("D:\\bda prac\\Restaurant Reviews.txt", quote = ",
stringsAsFactors = FALSE)
install.packages('tm')
install.packages('SnowballC')
library(tm)
library(SnowballC)
corpus = VCorpus(VectorSource(dataset original$Review))
corpus = tm map(corpus, content transformer(tolower))
corpus = tm map(corpus, removeNumbers)
corpus = tm map(corpus, removePunctuation)
corpus = tm map(corpus, removeWords, stopwords())
corpus = tm map(corpus, stemDocument)
corpus = tm map(corpus, stripWhitespace)
dtm = DocumentTermMatrix(corpus)
dtm = removeSparseTerms(dtm, 0.999)
dataset = as.data.frame(as.matrix(dtm))
dataset$Liked = dataset original$Liked
print(dataset$Liked)
datasetLiked = factor(datasetLiked, levels = c(0,1))
install.packages(caTools)
library(caTools)
set.seed(123)
split = sample.split(dataset$Liked, SplitRatio = 0.8)
training set = subset(dataset, split == TRUE)
test set = subset(dataset, split == FALSE)
install.packages('randomForest')
library(randomForest)
classifier = randomForest(x = training set[-692],
               y = training set$Liked,
               ntree = 10)
y pred = predict(classifier, newdata = test_set[-692])
cm = table(test set[,692], y pred)
print(cm)
Output:
                      > cm = table(test_set[,692], y_pred)
                       > print(cm)
                          y pred
                            0 1
                         0 82 18
                         1 23 77
```

Aim: Take the inbuilt data file: iris and perform classification on that data using various classification models – Decision Tree, K Nearest Neighbour and Support Vector Machine. Find the confusion matrix for all three models and evaluate them by finding their accuracy. Find the algorithm which performs best on the given data file, out of all these three models.

```
Code:
#PBL
install.packages('rpart')
install.packages('rpart.plot')
install.packages('gmodels')
install.packages('e1071')
library(rpart)
library(rpart.plot)

Aim: Install, configure and run Hadoop and HDFS and explore HDFS on Windows

Steps to Install Hadoop

- 1. Install Java JDK 1.8
- 2. Download Hadoop and extract and place under C drive
- 3. Set Path in Environment Variables
- 4. Config files under Hadoop directory
- 5. Create folder datanode and namenode under data directory
- 6. Edit HDFS and YARN files
- 7. Set Java Home environment in Hadoop environment
- 8. Setup Complete. Test by executing start-all.cmd

There are two ways to install Hadoop, i.e.

- 9. Single node
- 10. Multi node

Here, we use multi node cluster.

1. Install Java

- 11. Java JDK Link to download https://www.oracle.com/java/technologies/javase-jdk8-downloads.html
- 12. extract and install Java in C:\Java
- 13. open cmd and type -> javac -version

```
C:\Users>cd Beena

C:\Users\Beena>java -version
java version "1.8.0_361"

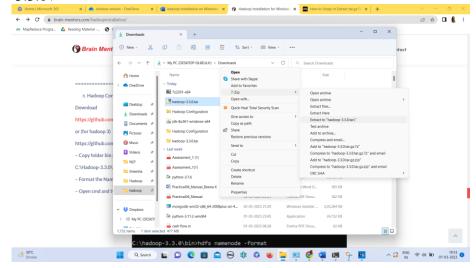

Java(TM) SE Runtime Environment (build 1.8.0_361-b09)

Java HotSpot(TM) 64-Bit Server VM (build 25.361-b09, mixed mode)
```

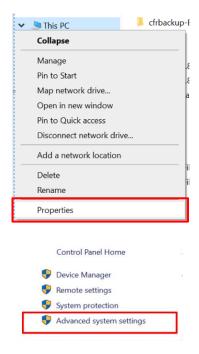

2. Download Hadoop

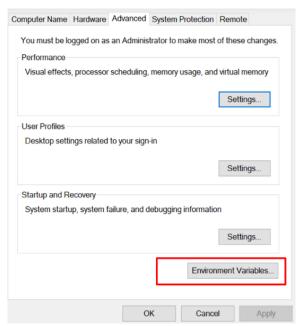

https://www.apache.org/dyn/closer.cgi/hadoop/common/hadoop-3.3.0/hadoop-3.3.0.tar.gz

• right click .rar.gz file -> show more options -> 7-zip->and extract to C:\Hadoop-3.3.0\

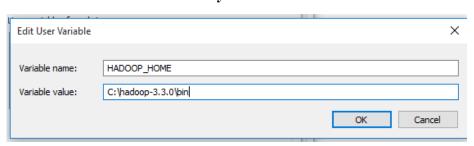

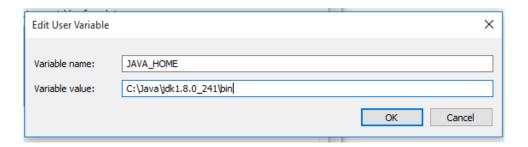

- 3. Set the path JAVA_HOME Environment variable
- 4. Set the path HADOOP_HOME Environment variable

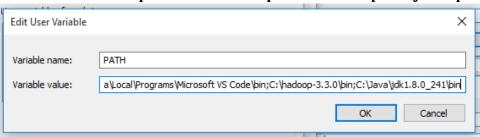

Click on New to both user variables and system variables.

Click on user variable -> path -> edit-> add path for Hadoop and java upto 'bin'

Click Ok, Ok, Ok.

5. Configurations

Edit file C:/Hadoop-3.3.0/etc/hadoop/core-site.xml,

Rename "mapred-site.xml.template" to "mapred-site.xml" and edit this file C:/Hadoop-3.3.0/etc/hadoop/mapred-site.xml, paste xml code and save this file.

<configuration>
< configuration>
<name>mapreduce.framework.name<value>yarn</value>

```
M.Sc.IT Sem-II
                                  Big Data Analytics
 </configuration>
Create folder "data" under "C:\Hadoop-3.3.0"
Create folder "datanode" under "C:\Hadoop-3.3.0\data"
Create folder "namenode" under "C:\Hadoop-3.3.0\data"
Edit file C:\Hadoop-3.3.0/etc/hadoop/hdfs-site.xml,
paste xml code and save this file.
<configuration>
property>
    <name>dfs.replication</name>
   <value>1</value>
 </property>
 property>
   <name>dfs.namenode.name.dir</name>
   <value>/hadoop-3.3.0/data/namenode
 </property>
 property>
    <name>dfs.datanode.data.dir</name>
   <value>/hadoop-3.3.0/data/datanode/value>
 </configuration>
Edit file C:/Hadoop-3.3.0/etc/hadoop/yarn-site.xml,
paste xml code and save this file.
<configuration>
```

```
M.Sc.IT Sem-II
                                 Big Data Analytics
 property>
        <name>yarn.nodemanager.aux-services</name>
        <value>mapreduce_shuffle</value>
 </property>
 property>
        <name>yarn.nodemanager.auxservices.mapreduce.shuffle.class</name>
        <value>org.apache.hadoop.mapred.ShuffleHandler
 </property>
 property>
            <name>yarn.resourcemanager.address</name>
            <value>127.0.0.1:8032</value>
 </property>
 property>
            <name>yarn.resourcemanager.scheduler.address</name>
            <value>127.0.0.1:8030</value>
  property>
            <name>yarn.resourcemanager.resource-tracker.address</name>
            <value>127.0.0.1:8031</value>
  </configuration>
6. Edit file C:/Hadoop-3.3.0/etc/hadoop/hadoop-env.cmd
```

```
Find "JAVA_HOME=%JAVA_HOME%" and replace it as set JAVA_HOME="C:\Java\jdk1.8.0_361"
```

7. Download "redistributable" package

Download and run VC_redist.x64.exe

This is a "redistributable" package of the Visual C runtime code for 64-bit applications, from Microsoft. It contains certain shared code that every application written with Visual C expects to have available on the Windows computer it runs on.

8. Hadoop Configurations

Download bin folder from

https://github.com/s911415/apache-hadoop-3.1.0-winutils

- Copy the bin folder to c:\hadoop-3.3.0. Replace the existing bin folder.
- 9. copy "hadoop-yarn-server-timelineservice-3.0.3.jar" from ~\hadoop-3.0.3\share\hadoop\yarn\timelineservice to ~\hadoop-3.0.3\share\hadoop\yarn folder.
- 10. Format the NameNode
- Open cmd 'Run as Administrator' and type command "hdfs namenode -format"

```
Administrator: Command Prompt

Microsoft Windows [Version 10.0.22621.1265]
(c) Microsoft Corporation. All rights reserved.

C:\Windows\System32>cd\hadoop-3.3.0\bin

C:\hadoop-3.3.0\bin>hdfs namenode -format
```

11. Testing

- Open cmd 'Run as Administrator' and change directory to C:\Hadoop-3.3.0\sbin
- type start-all.cmd

OR

- type start-dfs.cmd
- type start-yarn.cmd

```
C:\hadoop-3.3.0\sbin>start-all.cmd
This script is Deprecated. Instead use start-dfs.cmd and start-yarn.cmd
The filename, directory name, or volume label syntax is incorrect.
The filename, directory name, or volume label syntax is incorrect.
starting yarn daemons
The filename, directory name, or volume label syntax is incorrect.
```

- You will get 4 more running threads for Datanode, namenode, resouce manager and node manager

```
EX Apache Hadoop Distribution - hadoop namenode

```

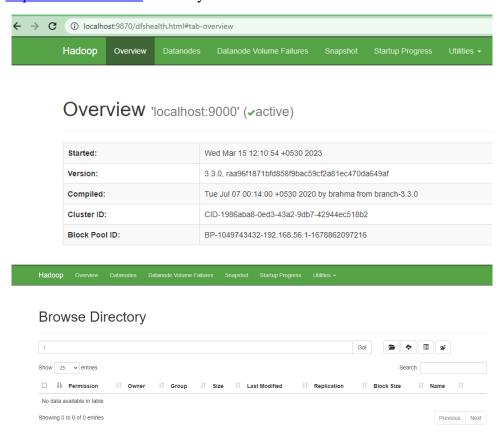

Output:

12. Type JPS command to start-all.cmd command prompt, you will get following output.

```
C:\hadoop-3.3.0\sbin>jps
5632 Jps
7572 DataNode
3752 ResourceManager
7992 NameNode
8028 NodeManager
```

Big Data Analytics

13. Run http://localhost:9870/ from any browser

Aim: Implement an application that stores big data in Hbase / MongoDB and manipulate it using R / Python

Requirements

- a. PyMongo
- b. Mongo Database

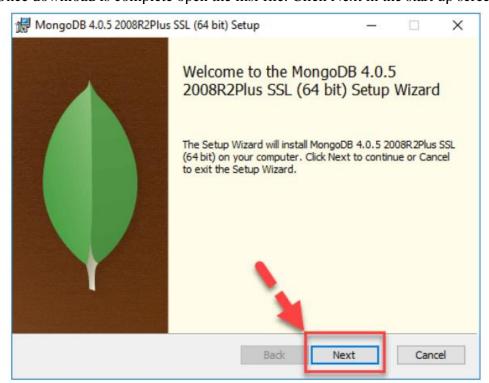

Step A: Install Mongo database

Step 1) Go to (https://www.mongodb.com/download-center/community) and Download MongoDB Community Server. We will install the 64-bit version for Windows.

Select the server you would like to run:

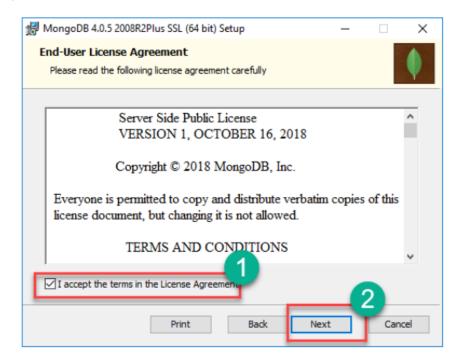

Step 2) Once download is complete open the msi file. Click Next in the start up screen

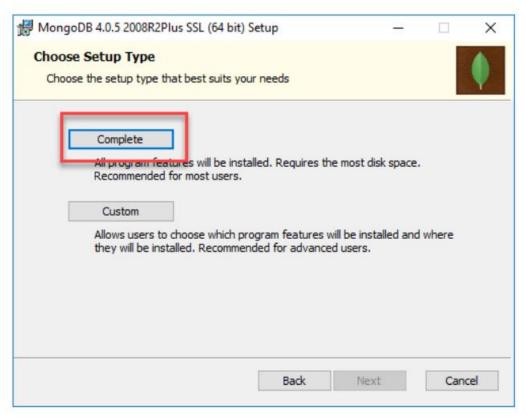

Step 3)

- 1. Accept the End-User License Agreement
- 2. Click Next

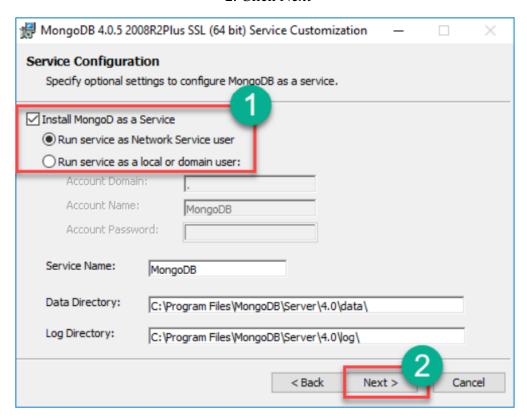

Step 4) Click on the "complete" button to install all of the components. The custom option can be used to install selective components or if you want to change the location of the installation.

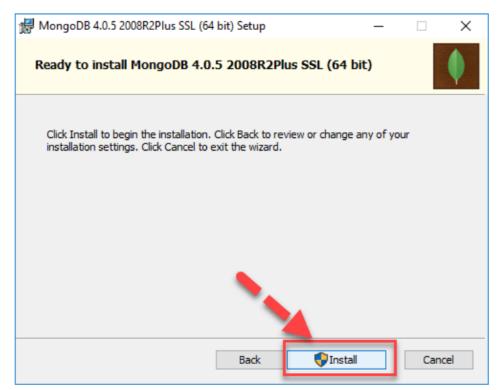

Step 5)

1. Select "Run service as Network Service user". make a note of the data directory, we'll need this later.

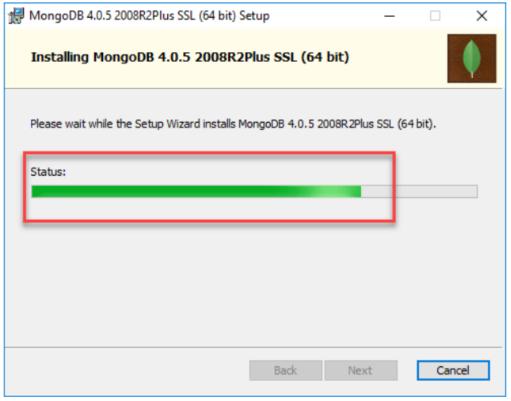

2. Click Next

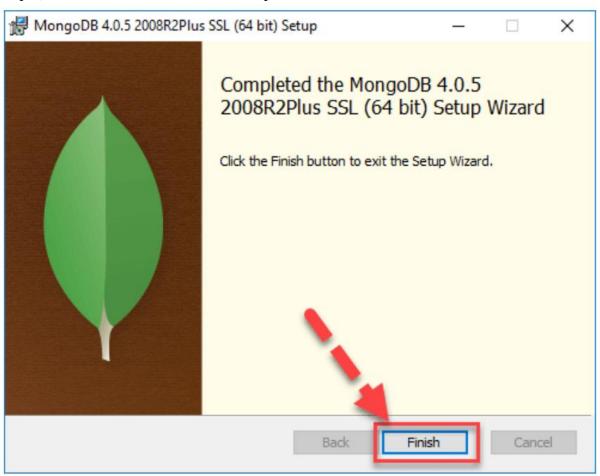

Step 6) Click on the Install button to start the installation.

Step 7) Installation begins. Click Next once completed.

Step 8) Click on the Finish button to complete the installation.

Test Mongodb

Step 1) Go to "C:\Program Files\MongoDB\Server\4.0\bin" and double click on **mongo.exe.** Alternatively, you can also click on the MongoDB desktop icon.

Create the directory where MongoDB will store its files.

Open command prompt window and apply following commands

C:\users\admin> cd\ C:\>md data\db

Step 2) Execute mongodb

Open another command prompt window.

C:\> cd C:\Program Files\MongoDB\Server\4.0\bin

C:\Program Files\MongoDB\Server\4.0\bin> mongod

In case if it gives an error then run the following command:

 $C:\Program\ Files\MongoDB\Server\4.0\bin>mongod-repair$

Step 3) Connect to MongoDB using the Mongo shell

Let the MongoDB daemon to run.

Open another command prompt window and run the following commands:

C:\users\admin> cd C:\Program Files\MongoDB\Server\4.0\bin

C:\Program Files\MongoDB\Server\4.0\bin>mongo

```
The monitoring data will be available on a MongoDB website with a unique URL accessible to you and anyone you share the URL with. MongoDB may use this information to make product improvements and to suggest MongoDB products and deployment options to you.

To enable free monitoring, run the following command: db.enableFreeMonitoring()
To permanently disable this reminder, run the following command: db.disableFreeMonitoring()
---
> show dbs
admin    0.000GB
config    0.000GB
local    0.000GB
mybigdata    0.000GB
> use mybigdata
```

Step 4) Install PyMongo

Open another command prompt window and run the following commands:

Check the python version on your desktop / laptop and copy that path from window explorer

C:\users\admin>cd C:\Program Files\Python311\Scripts

C:\Program Files\<Python38>\Scripts > python -m pip install pymongo

Note: # -m option is for <module-name>

Now you have downloaded and installed a mongoDB driver.

Step 5) Test PyMongo

Run the following command from python command prompt

import pymongo

Now, either create a file in Python IDLE or run all commands one by one in sequence on Python cell

Program 1: Creating a Database: create_dp.py

```
import pymongo
myclient = pymongo.MongoClient("mongodb://localhost:27017/")
mydb = myclient["mybigdata"]
print(myclient.list_database_names())
['admin', 'config', 'local']
```

Progam 2: Creating a Collection: create_collection.py

```
import pymongo
myclient = pymongo.MongoClient("mongodb://localhost:27017/")
mydb = myclient["mybigdata"]
mycol=mydb["student"]
print(mydb.list_collection_names())
[]
```

Progam 3: Insert into Collection: insert_into_collection.py

```
import pymongo
myclient = pymongo.MongoClient("mongodb://localhost:27017/")
mydb = myclient["mybigdata"]
mycol=mydb["student"]
mydict={"name":"Beena", "address":"Mumbai"}
x=mycol.insert_one(mydict) # insert_one(containing the name(s) and value(s) of each field
```

Program 4: Insert Multiple data into Collection: insert_many.py

```
import pymongo
myclient = pymongo.MongoClient("mongodb://localhost:27017/")
mydb = myclient["mybigdata"]
mycol=mydb["student"]
mylist=[{"name":"Khyati", "address":"Mumbai"}, {"name":"Kruti", "address":"Mumbai"},
{"name":"Nidhi", "address":"Pune"}, {"name":"Komal", "address":"Pune"},]
x=mycol.insert_many(mylist)
```

Step 6) Test in Mongodb to check database and data inserted in collection

a. If you want to check your database list, use the command show dbs in mongo command prompt

> show dbs

```
admin 0.000GB
config 0.000GB
local 0.000GB
mybigdata 0.000GB
```

- b. If you want to use a database with name mybigdata, then use database statement would be as follow:
- > use mybigdata

```
switched to db mybigdata
```

c. If you want to check collection in mongodb use the command show collections > show collections

student

d. If you want to display the first row from collection: db.collection_name.find() > db.student.findOne()

```
> db.student.findOne()
{
          "_id" : ObjectId("640178face663db608cef72f"),
          "name" : "Beena",
          "address" : "Mumbai"
}
```

e. If you want to display all the data from collection: db.collection_name.find()

> db.student.find()

```
: ObjectId("640178face663db608cef72f"),
: ObjectId("640179336ce317082c266dc1"),
: ObjectId("640179336ce317082c266dc2"),
id"
                                                                 "name
                                                                               "Beena'
                                                                                             'address'
                                                                               "Khyati
                                                                  'name'
                                                                                              "address
                                                                              "Kruti",
"Nidhi",
                                                                 "name"
                                                                                            "address"
     : ObjectId("640179336ce317082c266dc3"),
                                                                "name"
                                                                                           "address"
      : ObjectId("640179336ce317082c266dc4")
                                                                 "name"
```

f. count number of rows in a collection

> db.student.count()
